

CROX mouse

Day 0

Subject six hours after infusion of quantum duplication/biological enhancement compound. Subject displays enhanced sexual awareness and has masturbated to orgasm eight times since experiment began. Production of sexual fluids has increased by over 100%. Subject demonstrates increased levels of energy and friendliness. Subject is slated for release into the wild, pending further mutation. Current height: 2'9" (83.82cm)

Subject expresses discomfort with conventional footwear owing to increased size and sensitivity of paws. Notable growth has occurred in the hips and chest, as well as slight increase in height. Olfactory sensors in enclosure have registered increased pheromone density, causing mild euphoria in those whom inhale, including subject. Libido levels remain high, subject masturbates on an almost hourly basis.
Current height: 3'2" (96.52 cm)

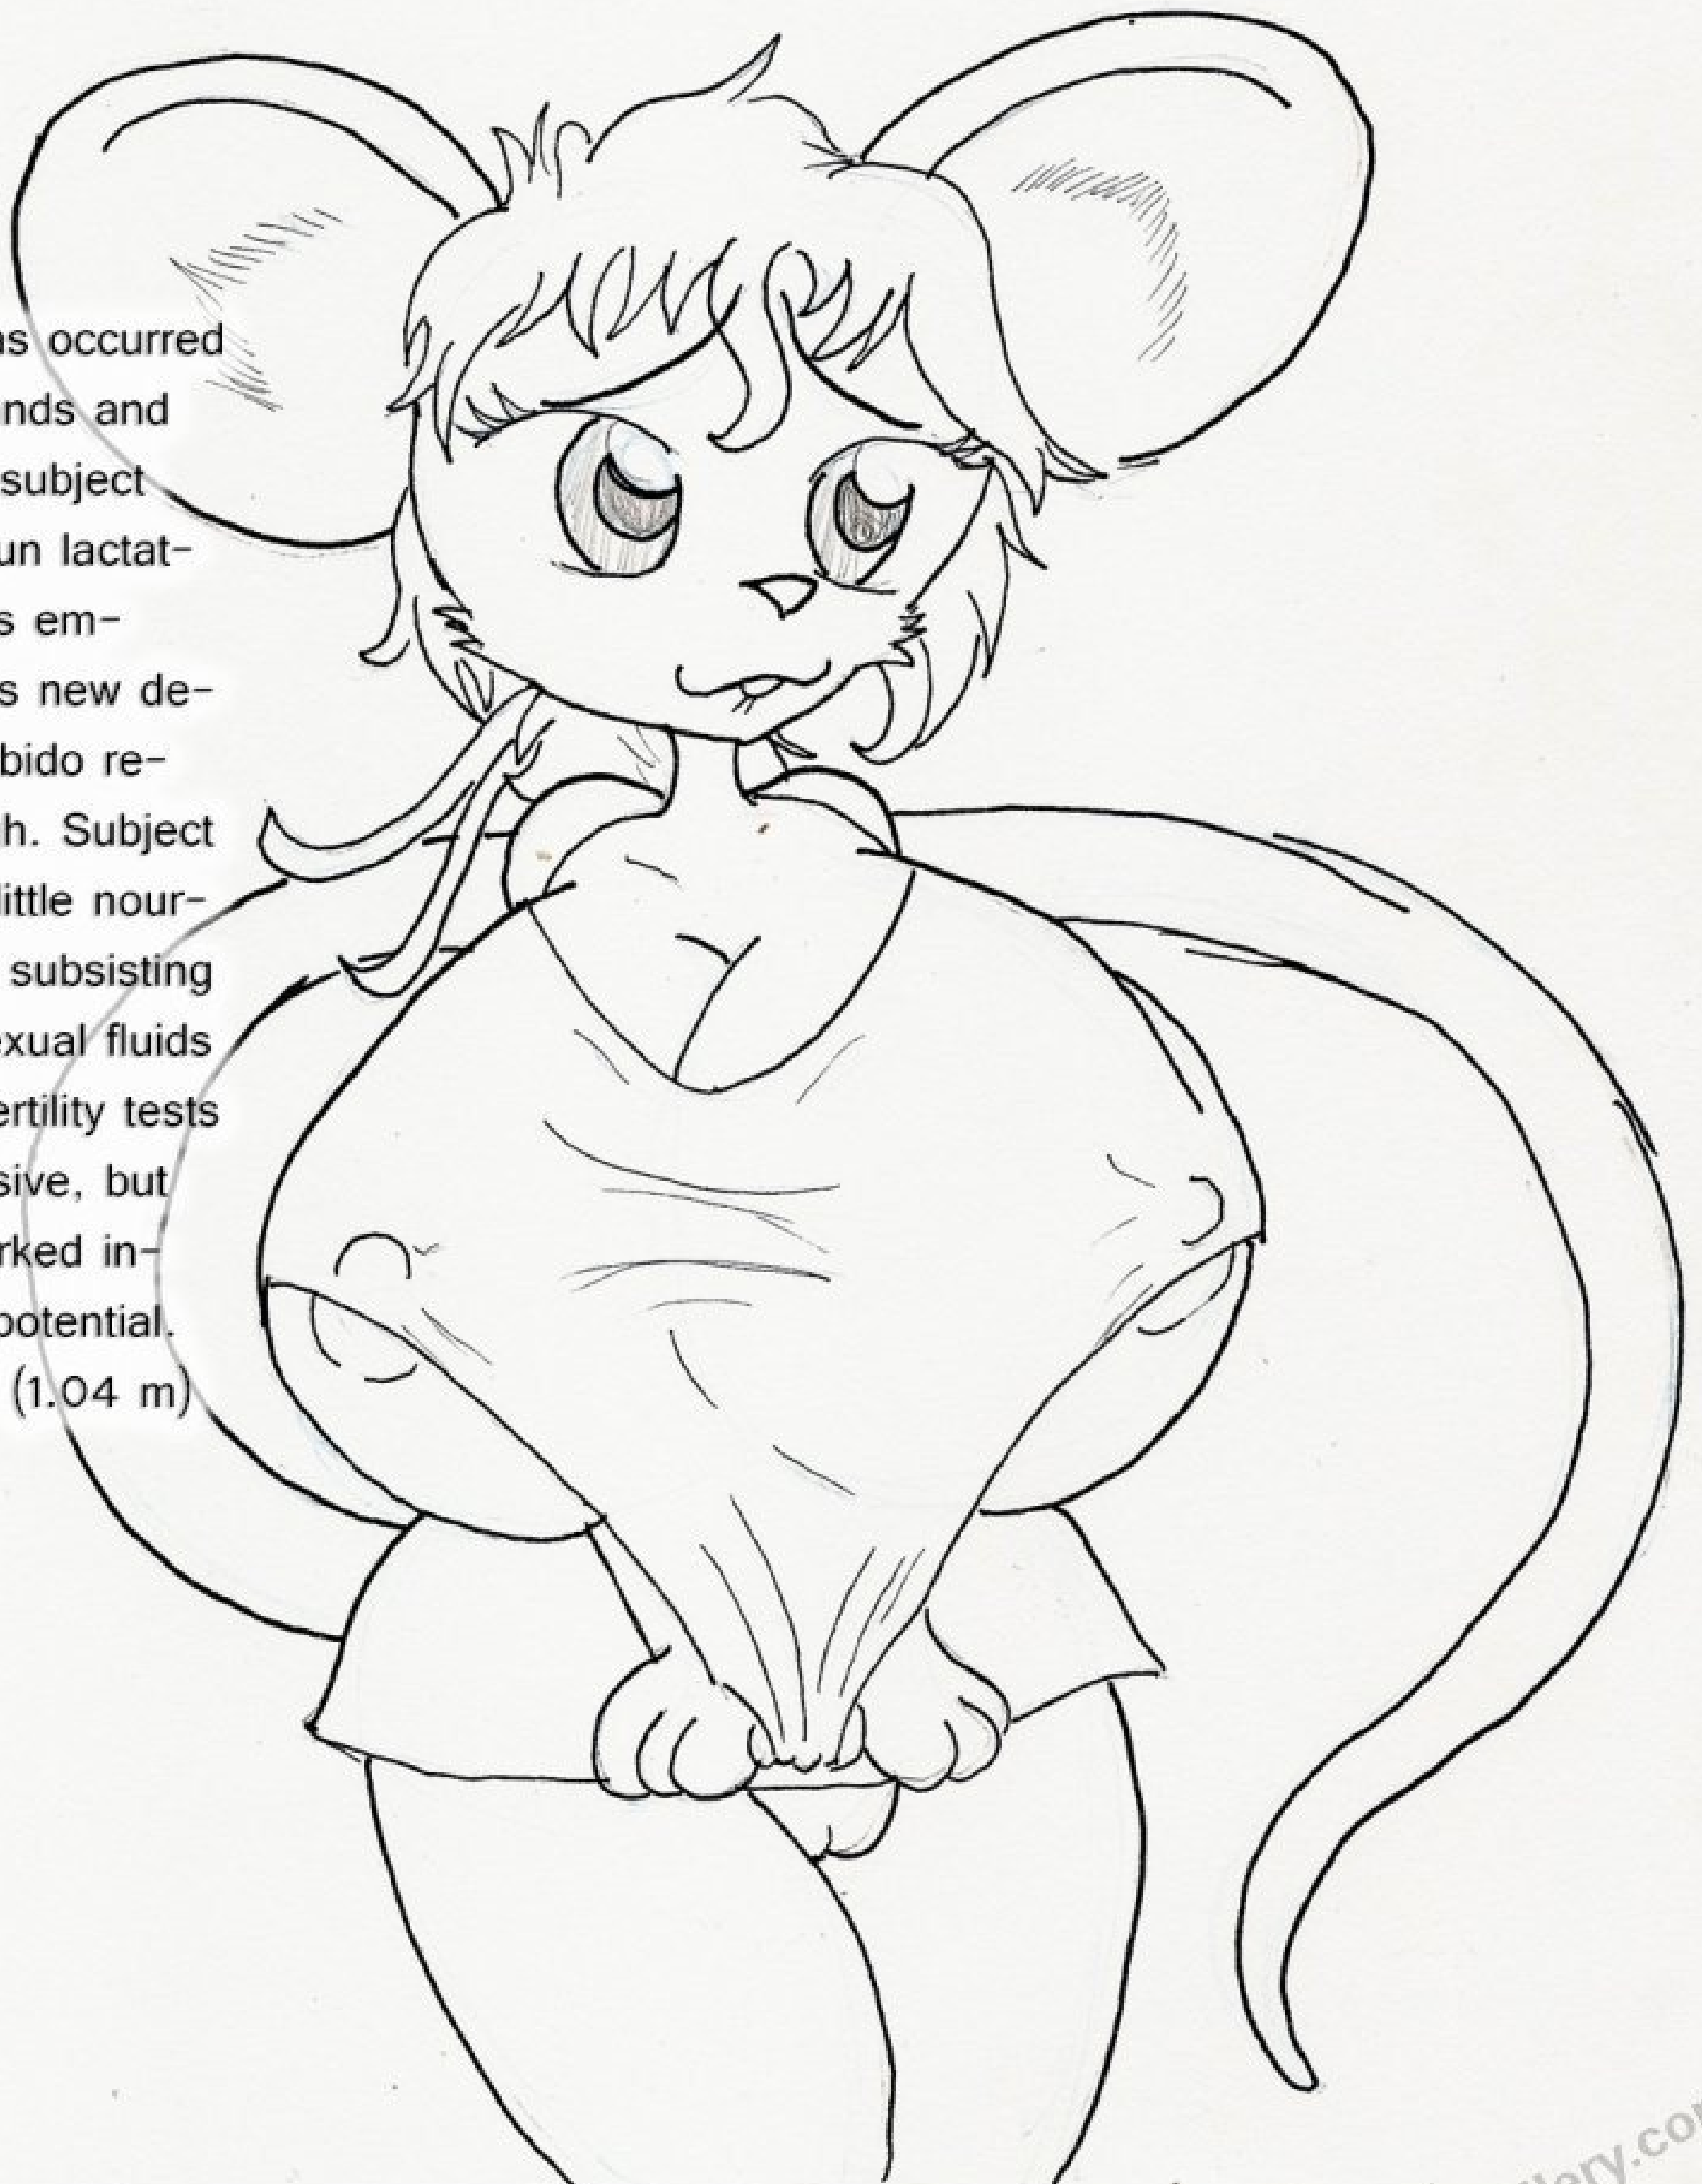

Day 1

Crowmouse

GROW mouse

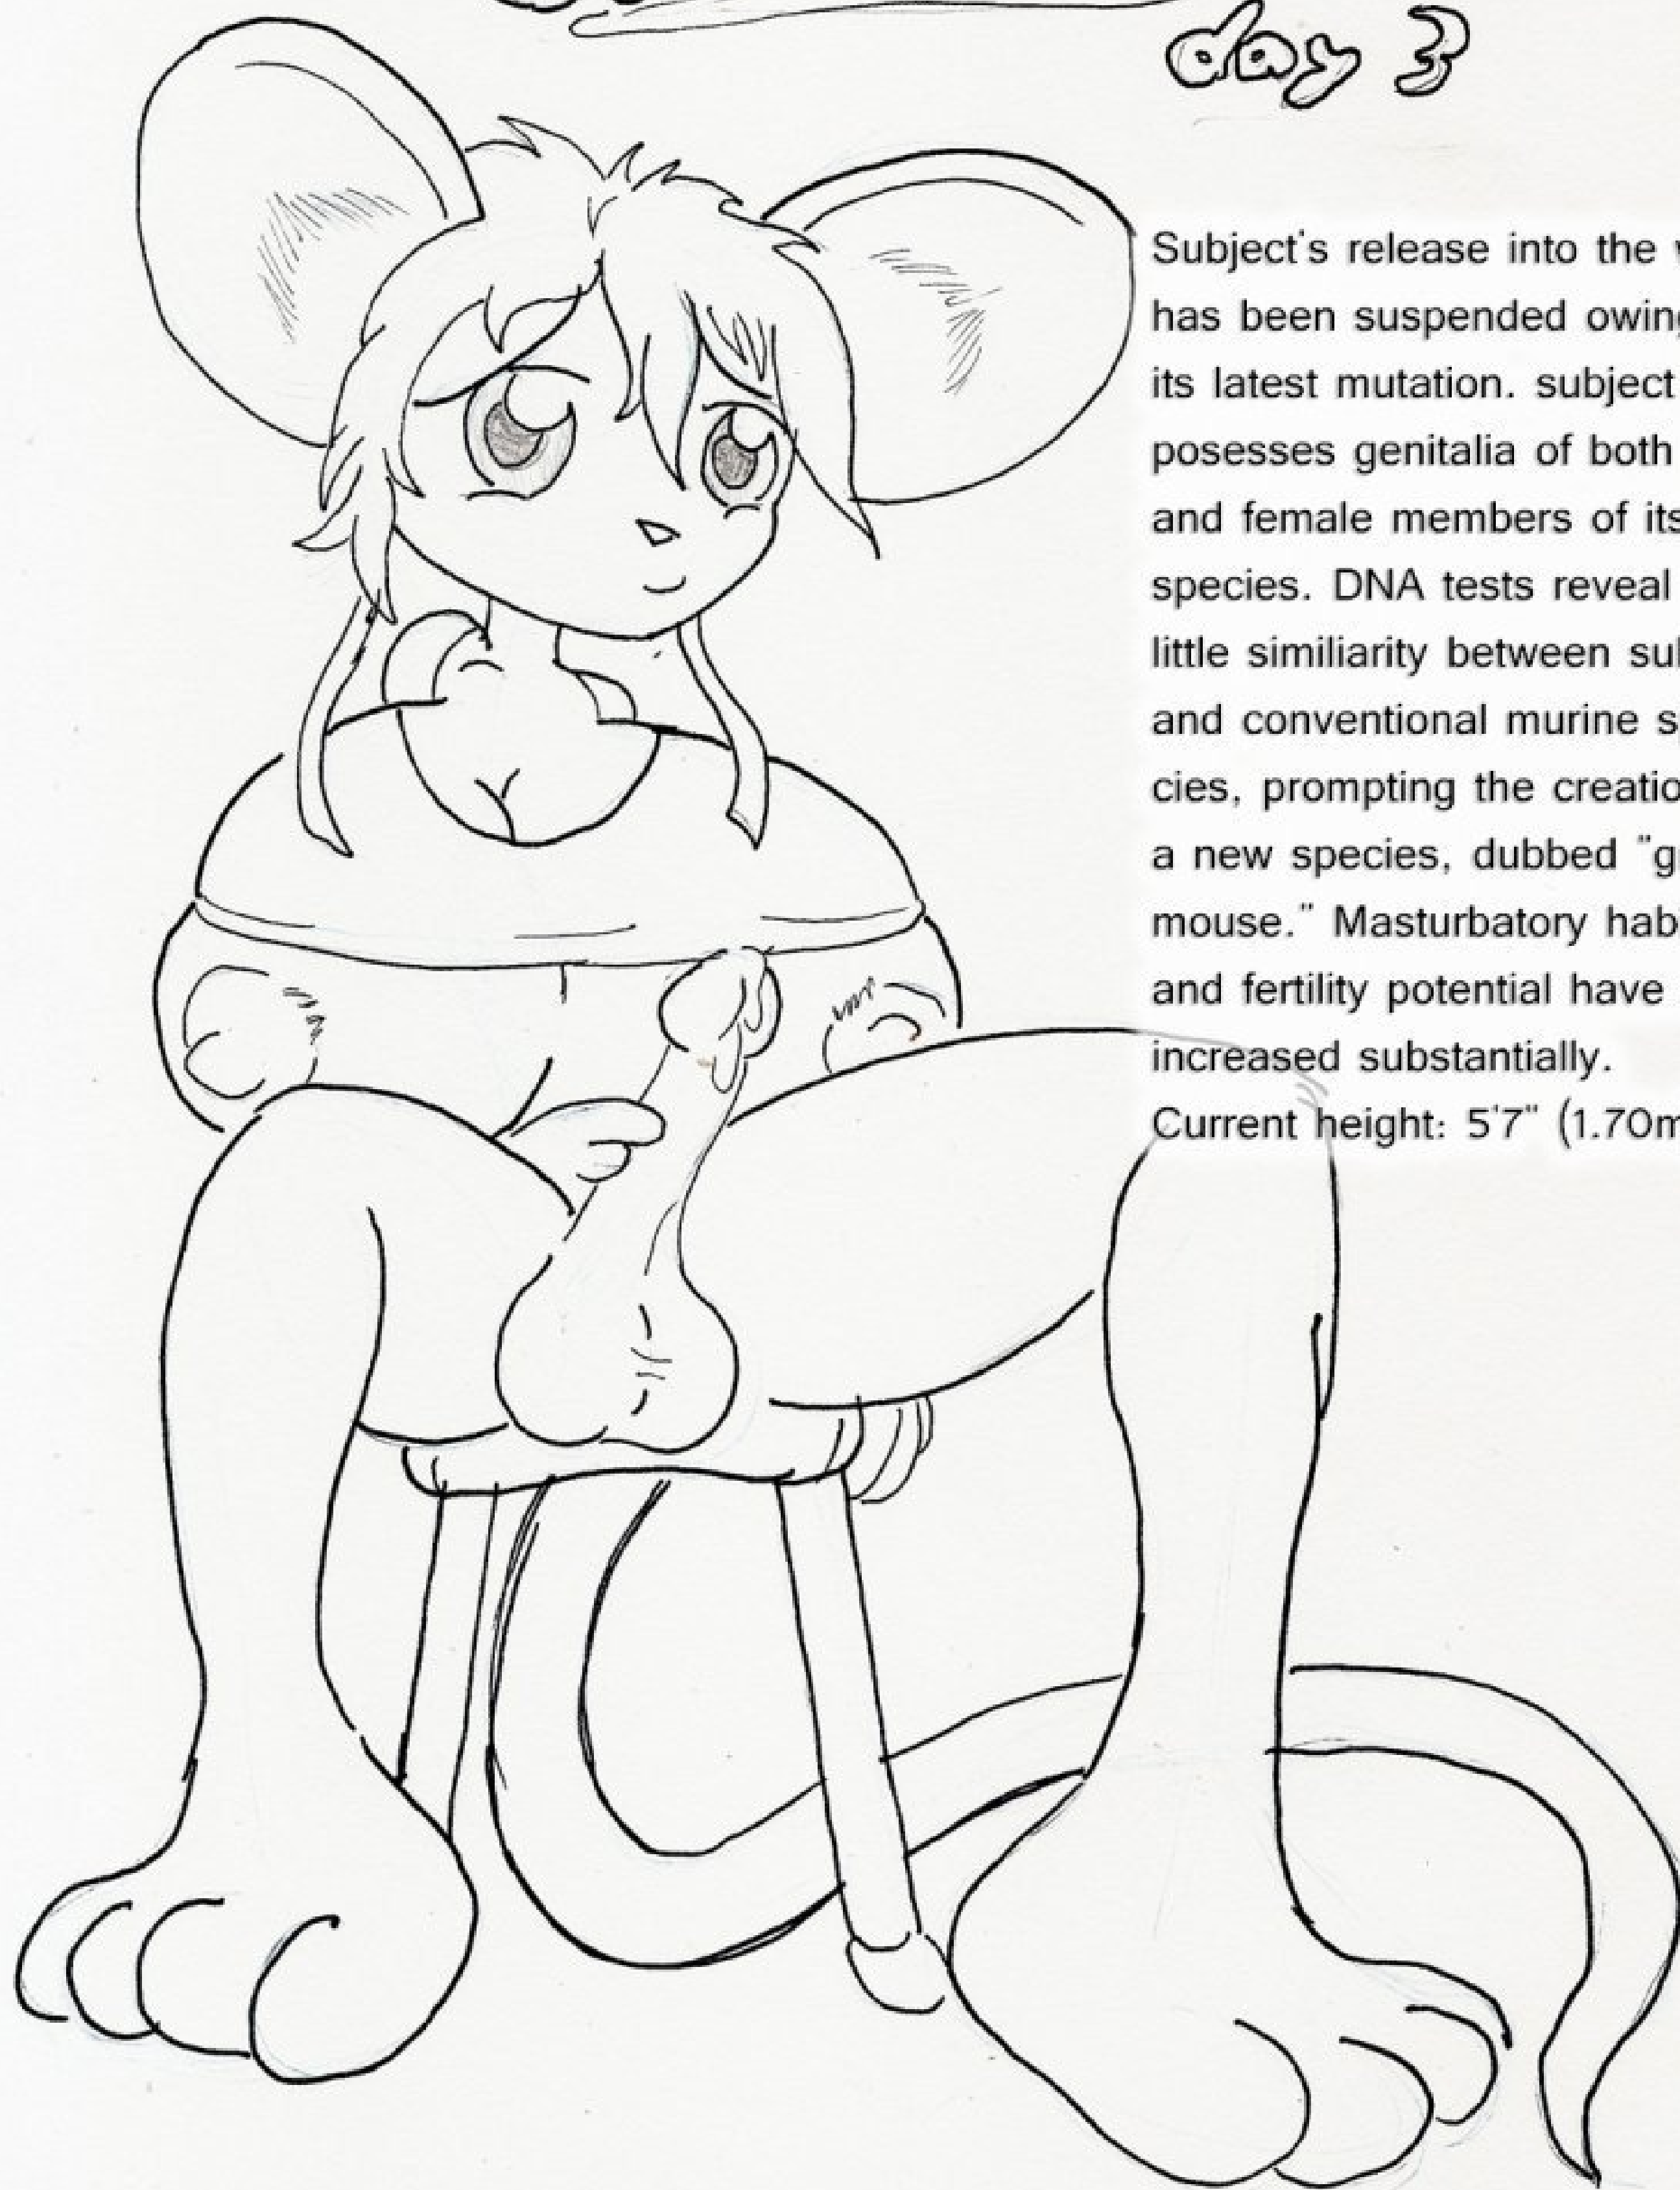

day 2

Extensive growth has occurred in the mammary glands and breast tissues, and subject has predictably begun lactating. Subject displays embarrassment over this new development, while libido remains extremely high. Subject seemingly requires little nourishment, apparently subsisting solely on its own sexual fluids and breast milk. Fertility tests have been inconclusive, but data points to a marked increase in breeding potential. Current height: 3'5" (1.04 m)

GROWmouse

day 3

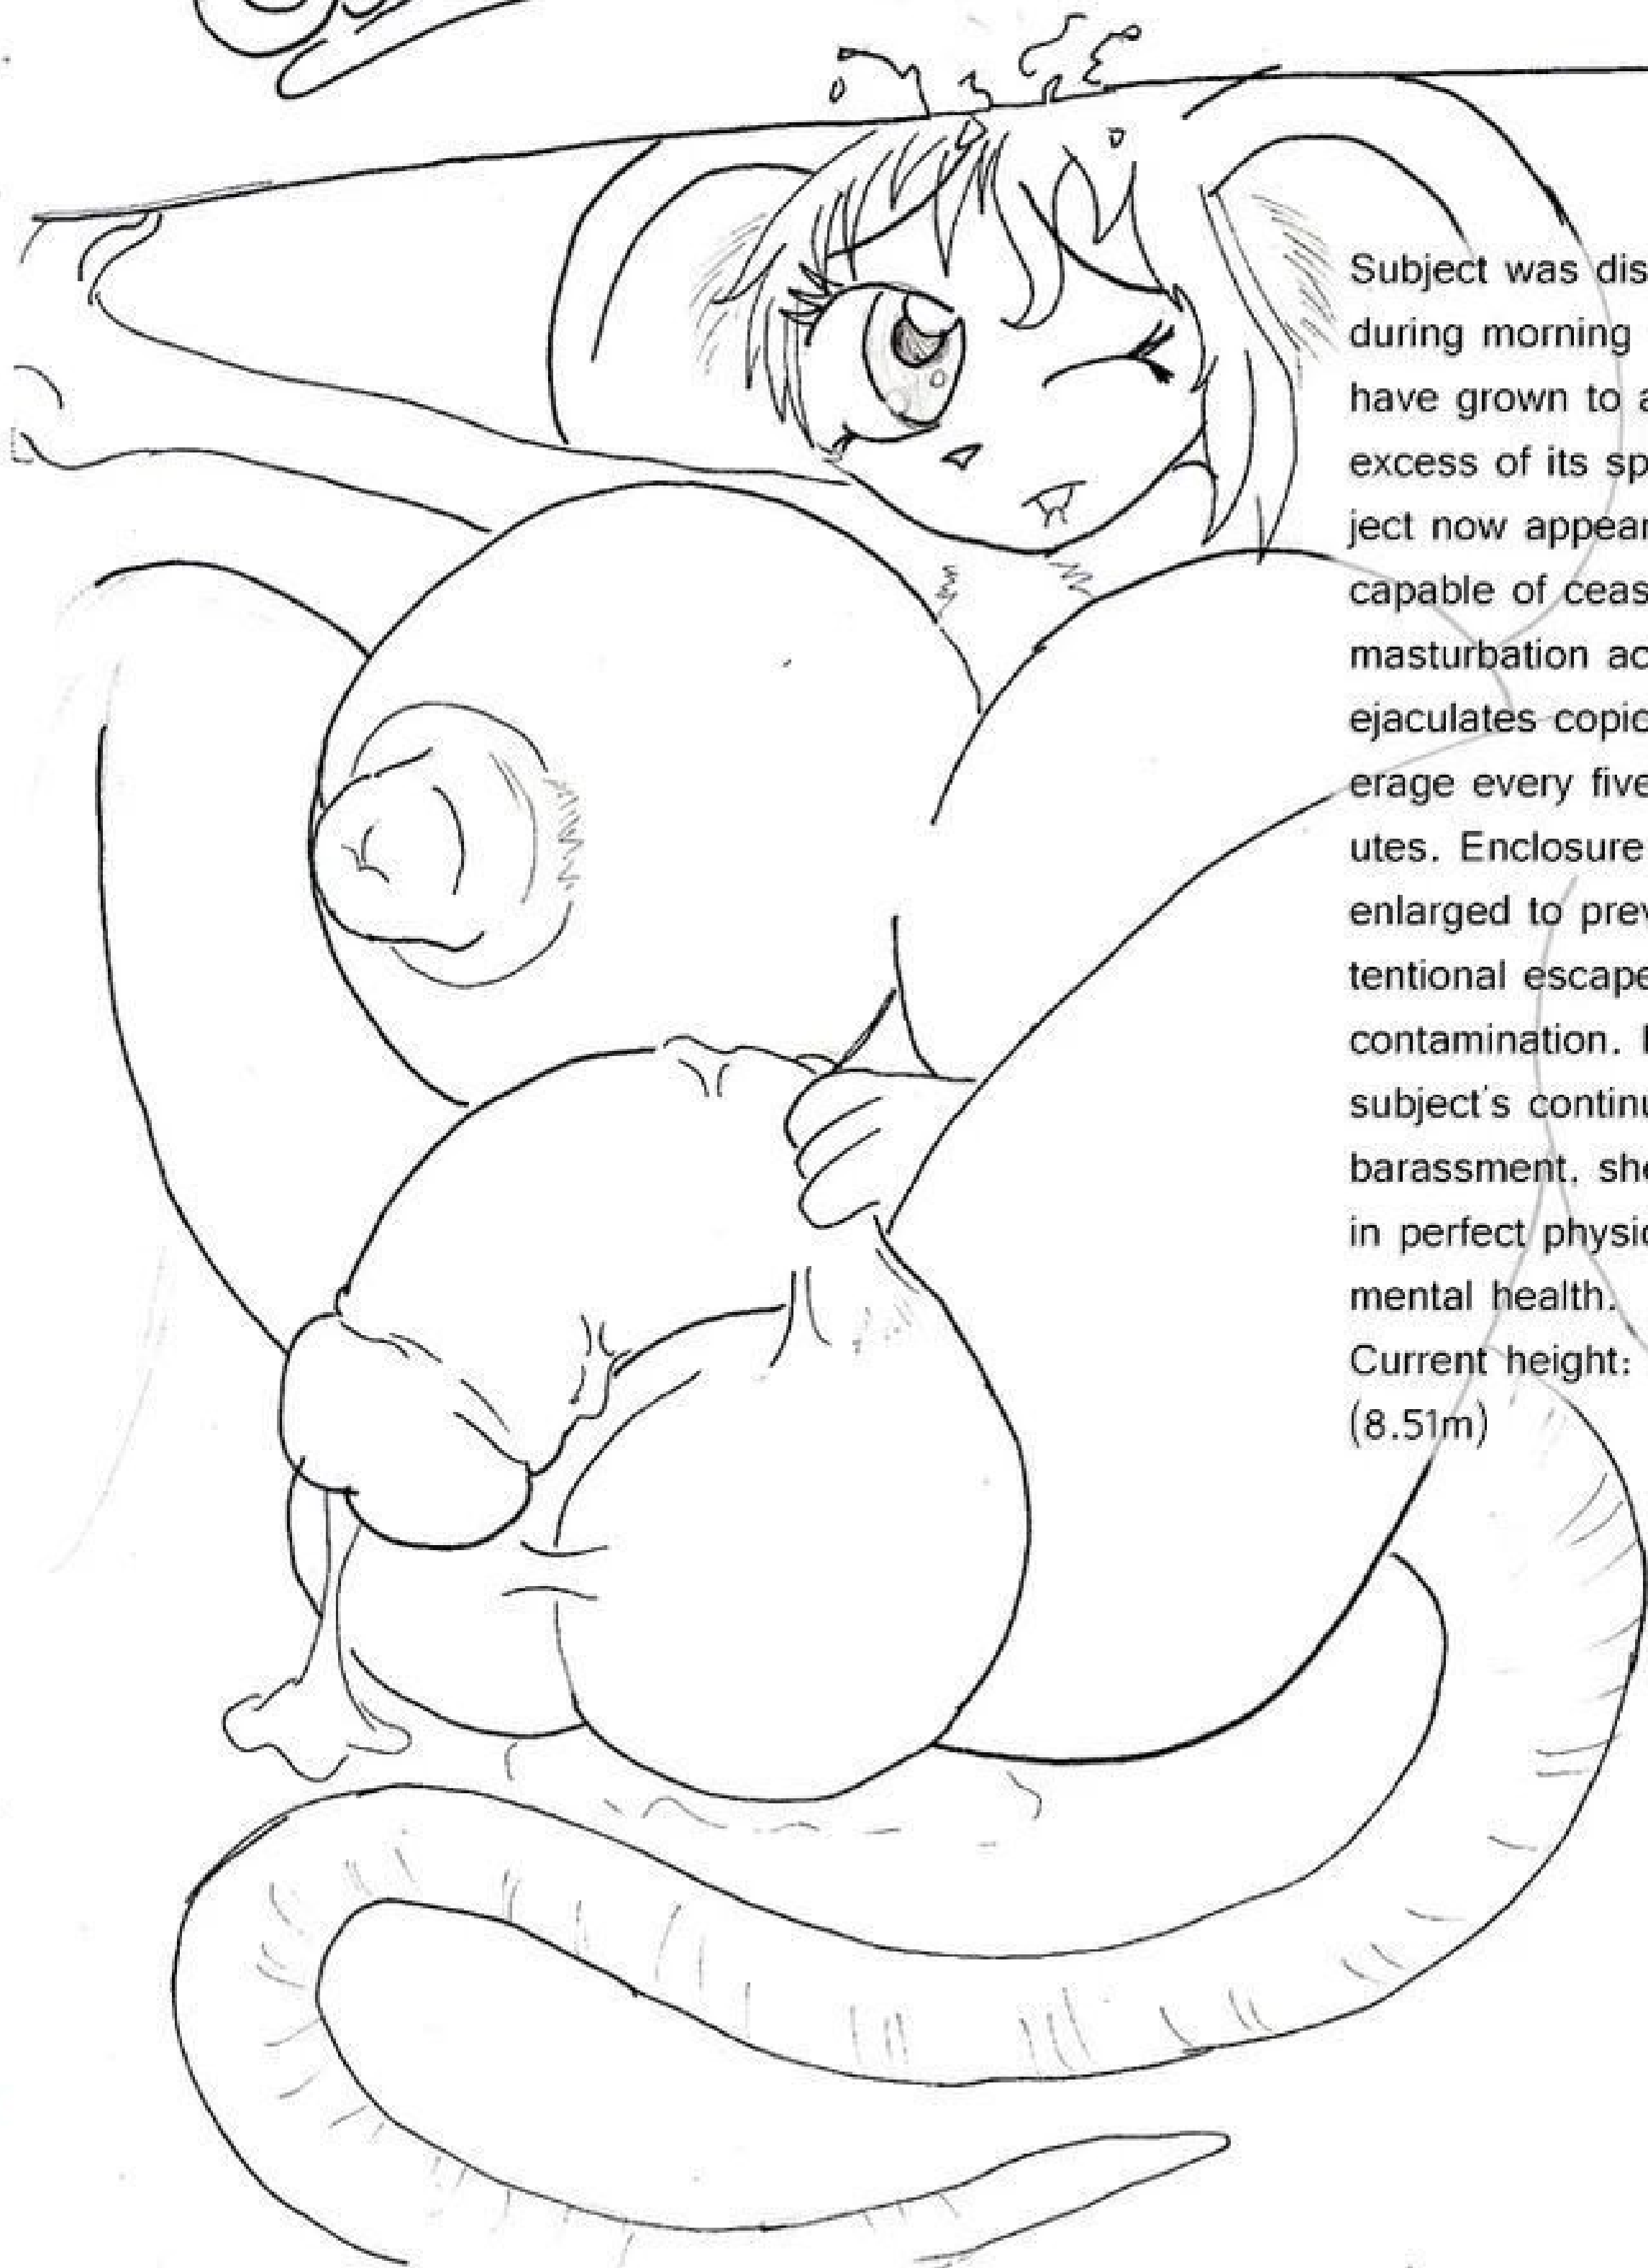

Subject's release into the wild has been suspended owing to its latest mutation. subject now possesses genitalia of both male and female members of its species. DNA tests reveal very little similiarity between subject and conventional murine species, prompting the creation of a new species, dubbed "growmouse." Masturbatory habits and fertility potential have both increased substantially.

Current height: 5'7" (1.70m)

GROWHOUSE

day 4

Subject was discovered during morning feeding to have grown to a size far in excess of its species. Subject now appears to be incapable of ceasing its masturbation activities, and ejaculates copiously on average every five(5) minutes. Enclosure must be enlarged to prevent unintentional escape and/or contamination. Despite subject's continued embarrassment, she remains in perfect physical and mental health.

Current height: 27'11"
(8.51m)

grow mouse

day 5

Measurements taken have shown that subject has continued to grow at a rapid pace. Most astoundingly, however, the subject has apparently somehow self-inseminated and conceived offspring, who's gestation is proving to be extremely rapid, with external signs of pregnancy already apparent. Subject lactates constantly and seems to require little to no stimulation to achieve orgasm. As subject is in a state of constant growth, height will now include a timestamp. Subject release may now prove inevitable.

Height as of 0830hrs: 35'8"
(10.87m)

Data collected before subject's unsanctioned but necessary release suggests that subject's pheromones somehow escaped, causing minor, containable mutations in local fauna. Further containment may prove futile, as subject's production and release of sexual fluids and milk have reached extreme levels. Subject appears to now express confusion instead of embarrassment over her continual growth, deriving pleasure and seemingly increased arousal from the expedited development of her offspring.

Height as of 1215hrs:
53'9" (16.38m)

GROW
mouse

day 6

GROW mouse

day 7

Subject's growth rate has drastically increased as she has entered a state of labor. She has birthed a number of offspring greater than expected, and seems to be continuously birthing more as time passes. Any hope of containment is now lost, as each offspring seems to have inherited all of the original subject's traits, including extreme levels of growth, fertility, and mutagenic properties. Observation and documentation will continue. Original subject has mutated into a quadrapedal state, presumably in order to support her ongoing pregnancy while maintaining mobility. She now displays unadulterated delight at her current state, no doubt due in part to the undeniably overwhelming amounts of pleasure she's experiencing.

Height as of 0920hrs: 88'10" (27.08m)

#Offspring as of 0920hrs: 51

Subject's size has reached unpredicted levels. Observation equipment is proving insufficient to collect data properly. It would appear that other than some superficial differences in proportions, each member of the original subject's progeny are effectively clones of her. Local authorities have begun an evacuation of the city, as the mutagenic properties of the subject's pheromones and fluids, along with that of her offspring, have caused any animal life exposed to transform into another instance of the subject, further progressing the ongoing population explosion as each growmouse self-impregnates and increases in size. Though mating still occurs, the process seems to only hasten growth and production of offspring, fluids, and pheromones.

Height as of 1025hrs: 3,467' (1.06km)

#Offspring as of 1025hrs: 787,044
