

Specimen Alpha was released into the wild via phase translocation in proximity to human subjects. Alpha has been exposed to a refined variant of quantum-bio-enhancement compound 77, results are as follows. Alpha appears distressed, and it is unknown if release of defensive musk was instinctive or entirely involuntary. Release was accompanied by explosive growth of subject.

Human subject, dubbed Specimen Beta, has been exposed to secondary compound 77, contained in Alpha's spray. In their distressed state, they return to an apparent campsite, already in rapid transformation into a secondary instance of alpha, although anthropomorphic and hermaphroditic. Simultaneous documentation of both alpha and beta begins here. Beta shows signs of increased sex drive and reproductive capacity almost immediately, euphoria clouding their higher brain functions, potentially reducing them to little more than a feral fuck beast.

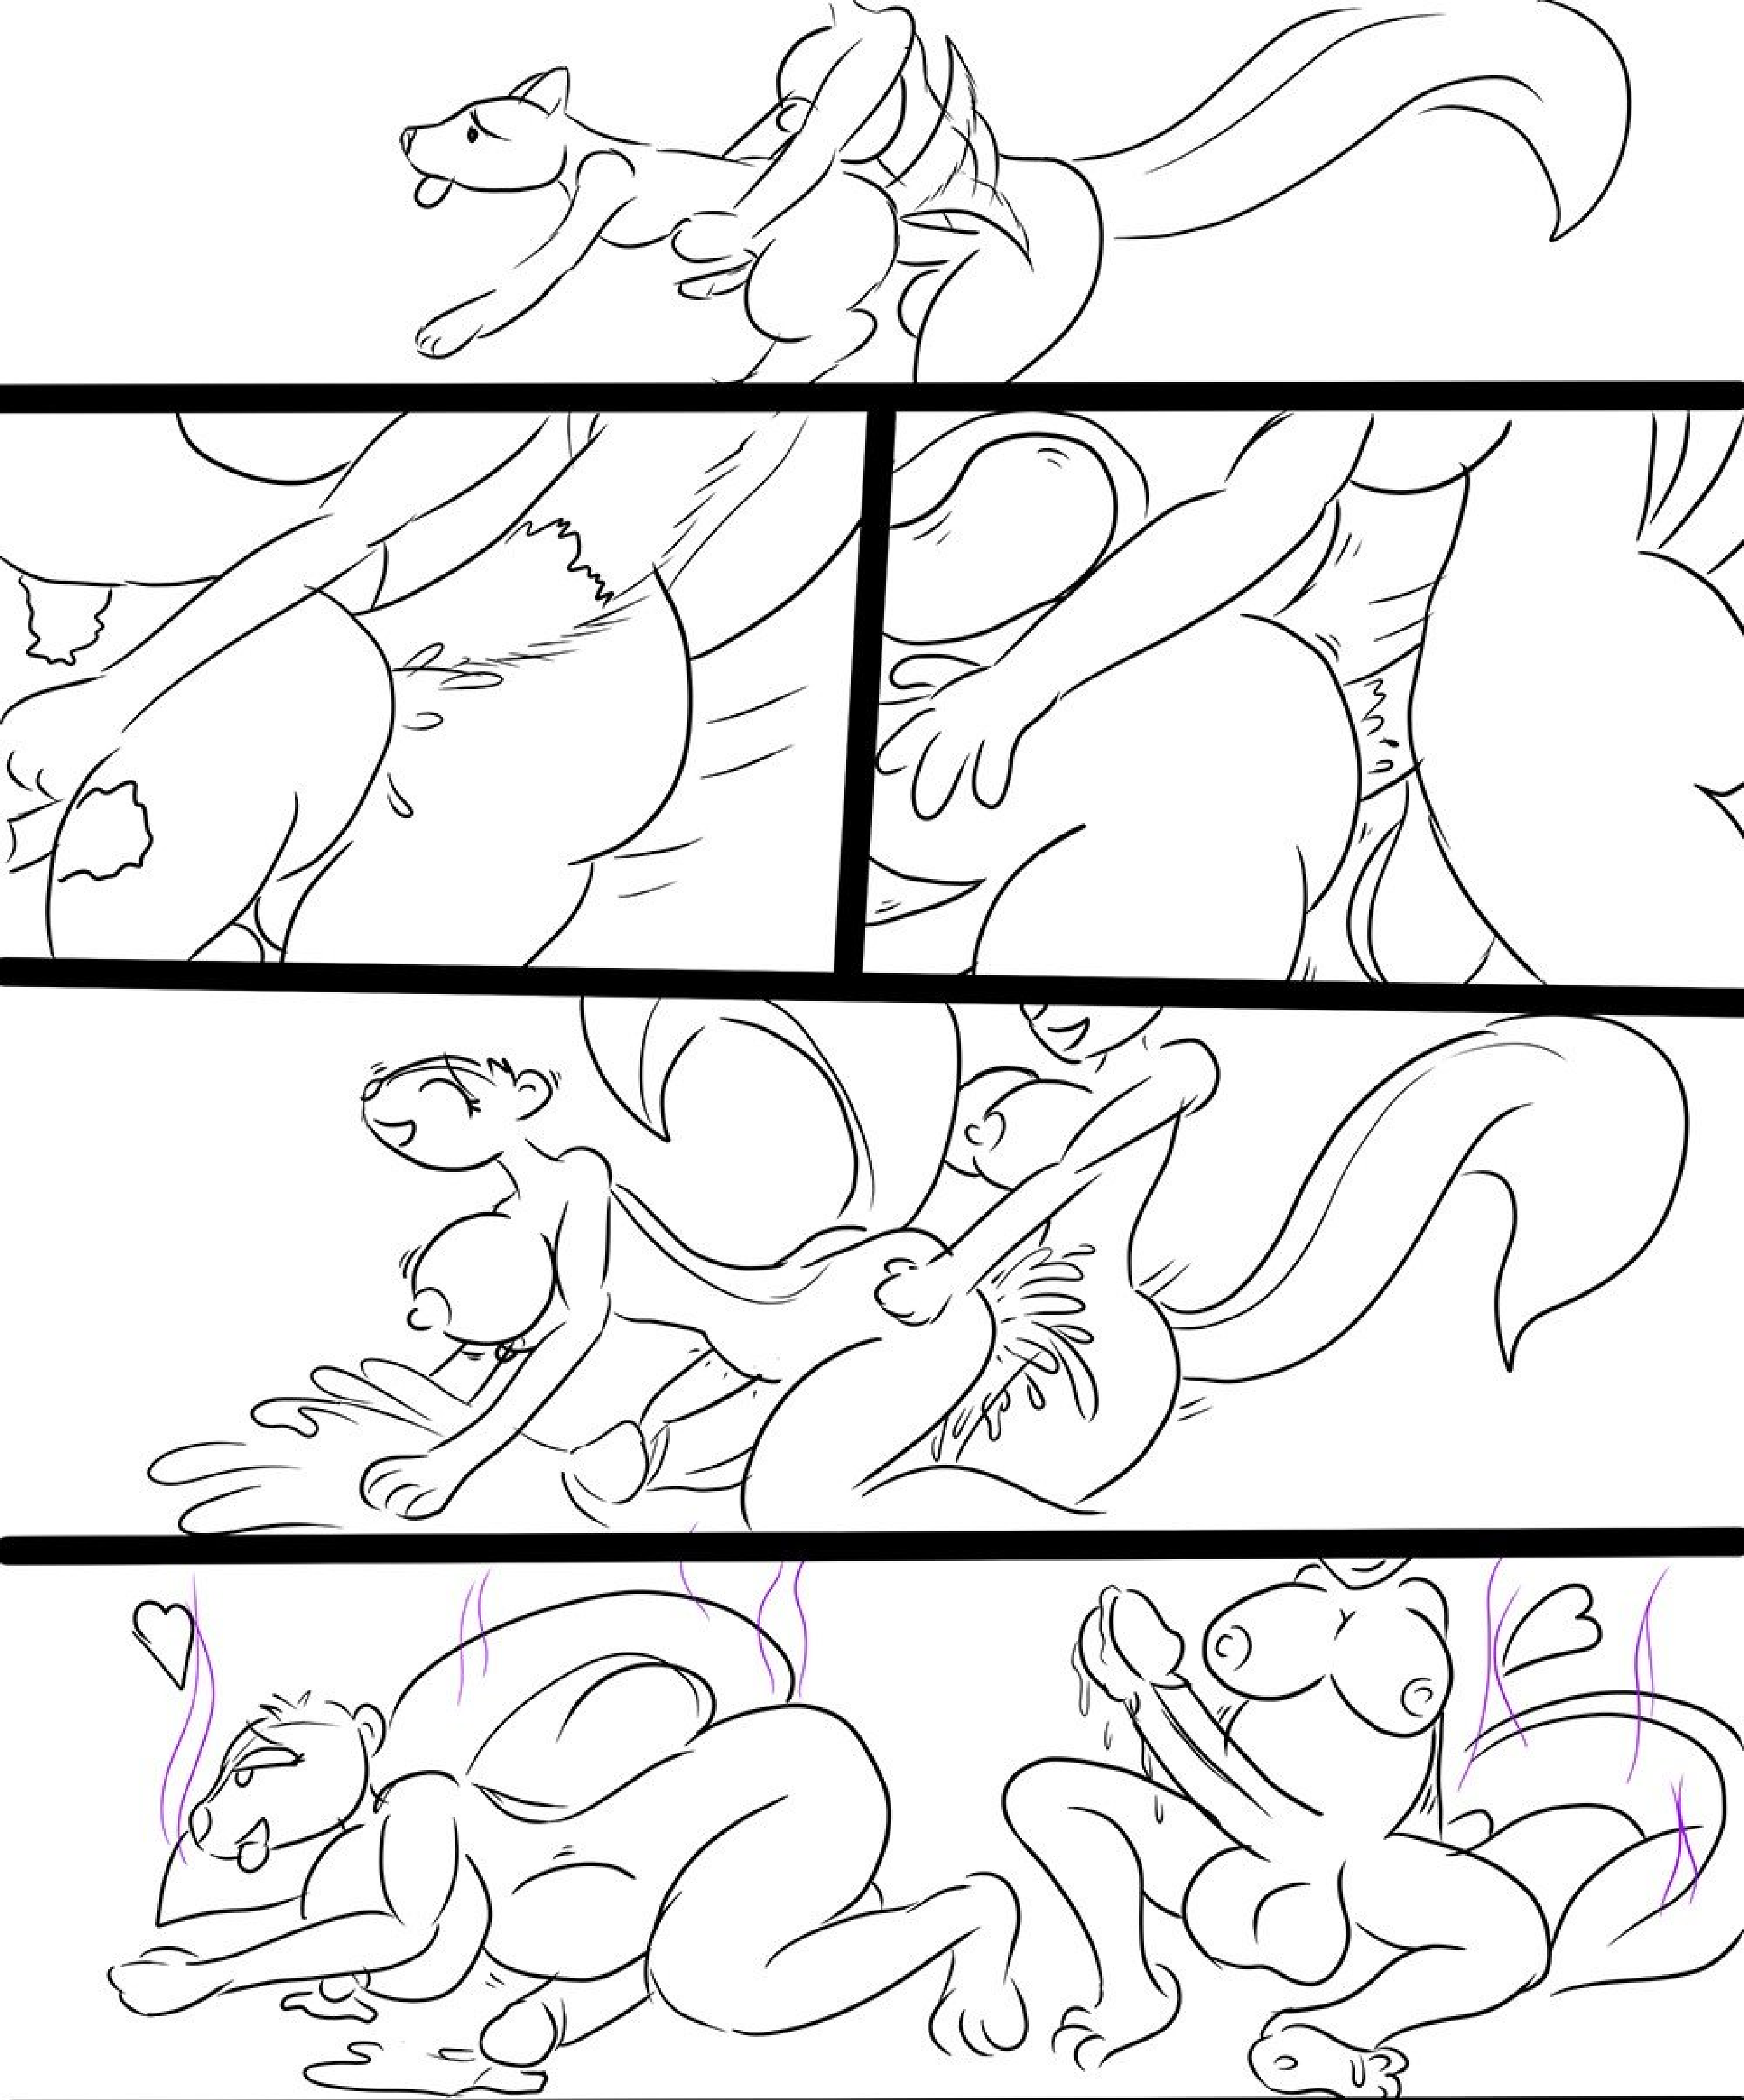

Beta begins growing larger, their sexual attributes increasing more and more. Masturbation begins as well, her friends appearing understandably curious about her condition. It is possible exposure to her pheromones has reduced their sense of caution. Beta sprays them with her own musk, which is plainly quite stimulating to her. Her friends transform very rapidly and begin to masturbate as well, as Beta begins a predictable bout of lactation. Sizes and libidos continue to increase.

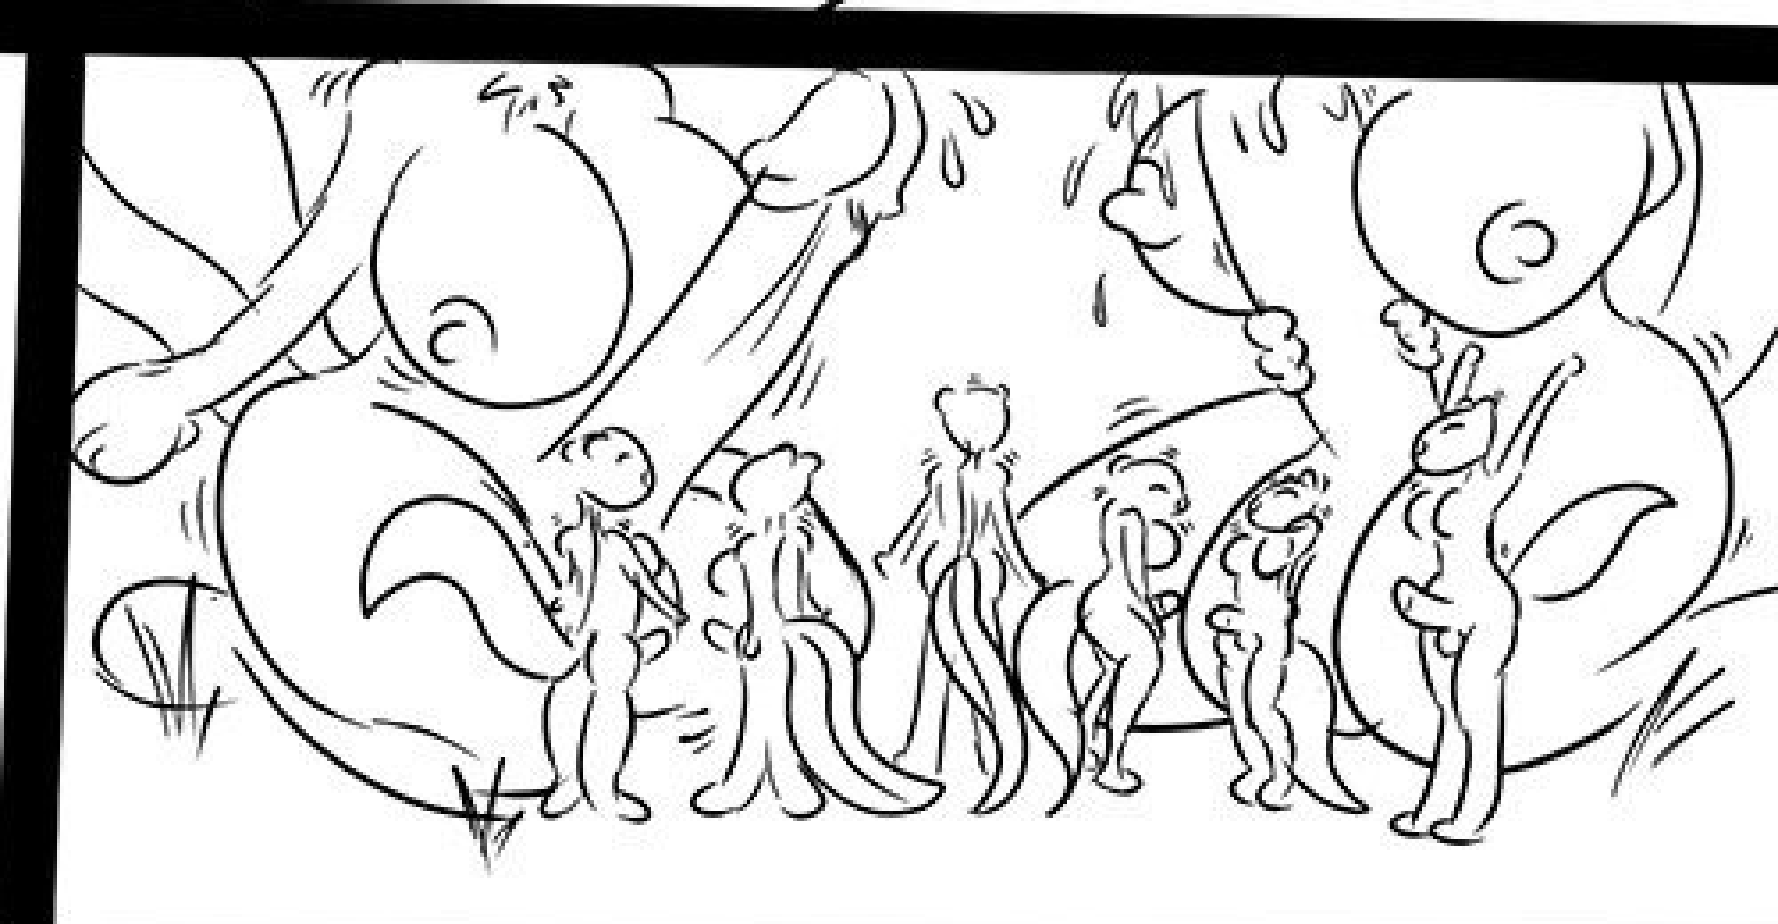

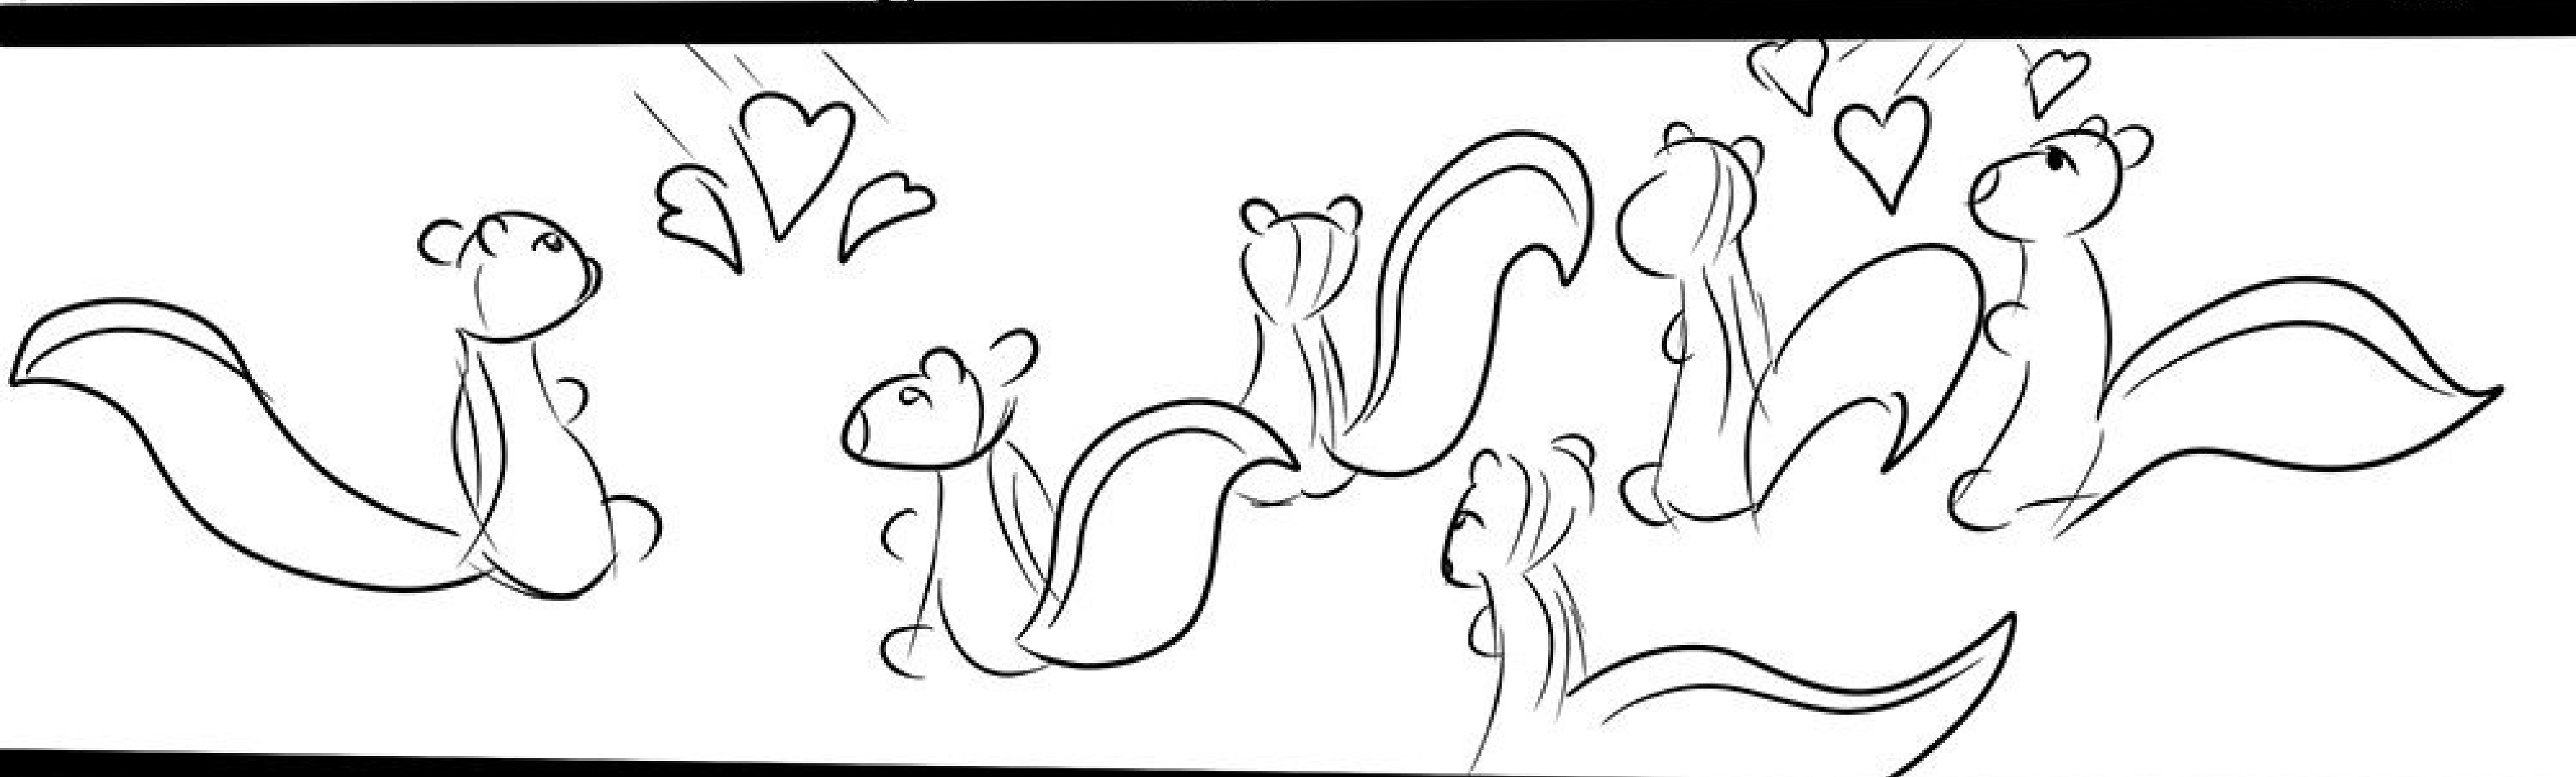

As mating begins, parthenogenic reproduction begins, the mating only serving to accelerate the gestation process and further enhance the size of the litters being created. Mutation also begins taking place, as one of the beta-made subjects (I lost track of who was who, they're all clones, so whatever, right?) sprouts a generous non-morphic hind section, rendering them tauric. Musk fills the air now, all the subjects appearing to spray with each thrust. Birth begins only moments later, as smaller herm skunks are born and immediately bathed in their mother's musk.

Specimen Alpha has escaped deeper into the woods, no doubt following instinct. It experiences another wave of explosive growth, by now at least three times larger than untainted members of its kind. Its face and body mutate, becoming more humanoid, possibly due to its exposure to subject Beta. A wolf, clearly wary of the skunk's distinct coloration, tries to edge around Alpha. Alpha displays a blatant attraction to the wolf, seeming to release musk less as a defensive measure, and more as a mating tool. The wolf, dubbed Specimen Gamma, is plainly aroused by the scent of the musk. Atmospheric sensors show that the musk no longer carries any of the "stink" chemicals common to normal skunk variants, but now has many complex pheromones and of course the ever-increasing mutagenic qualities of compound 77.

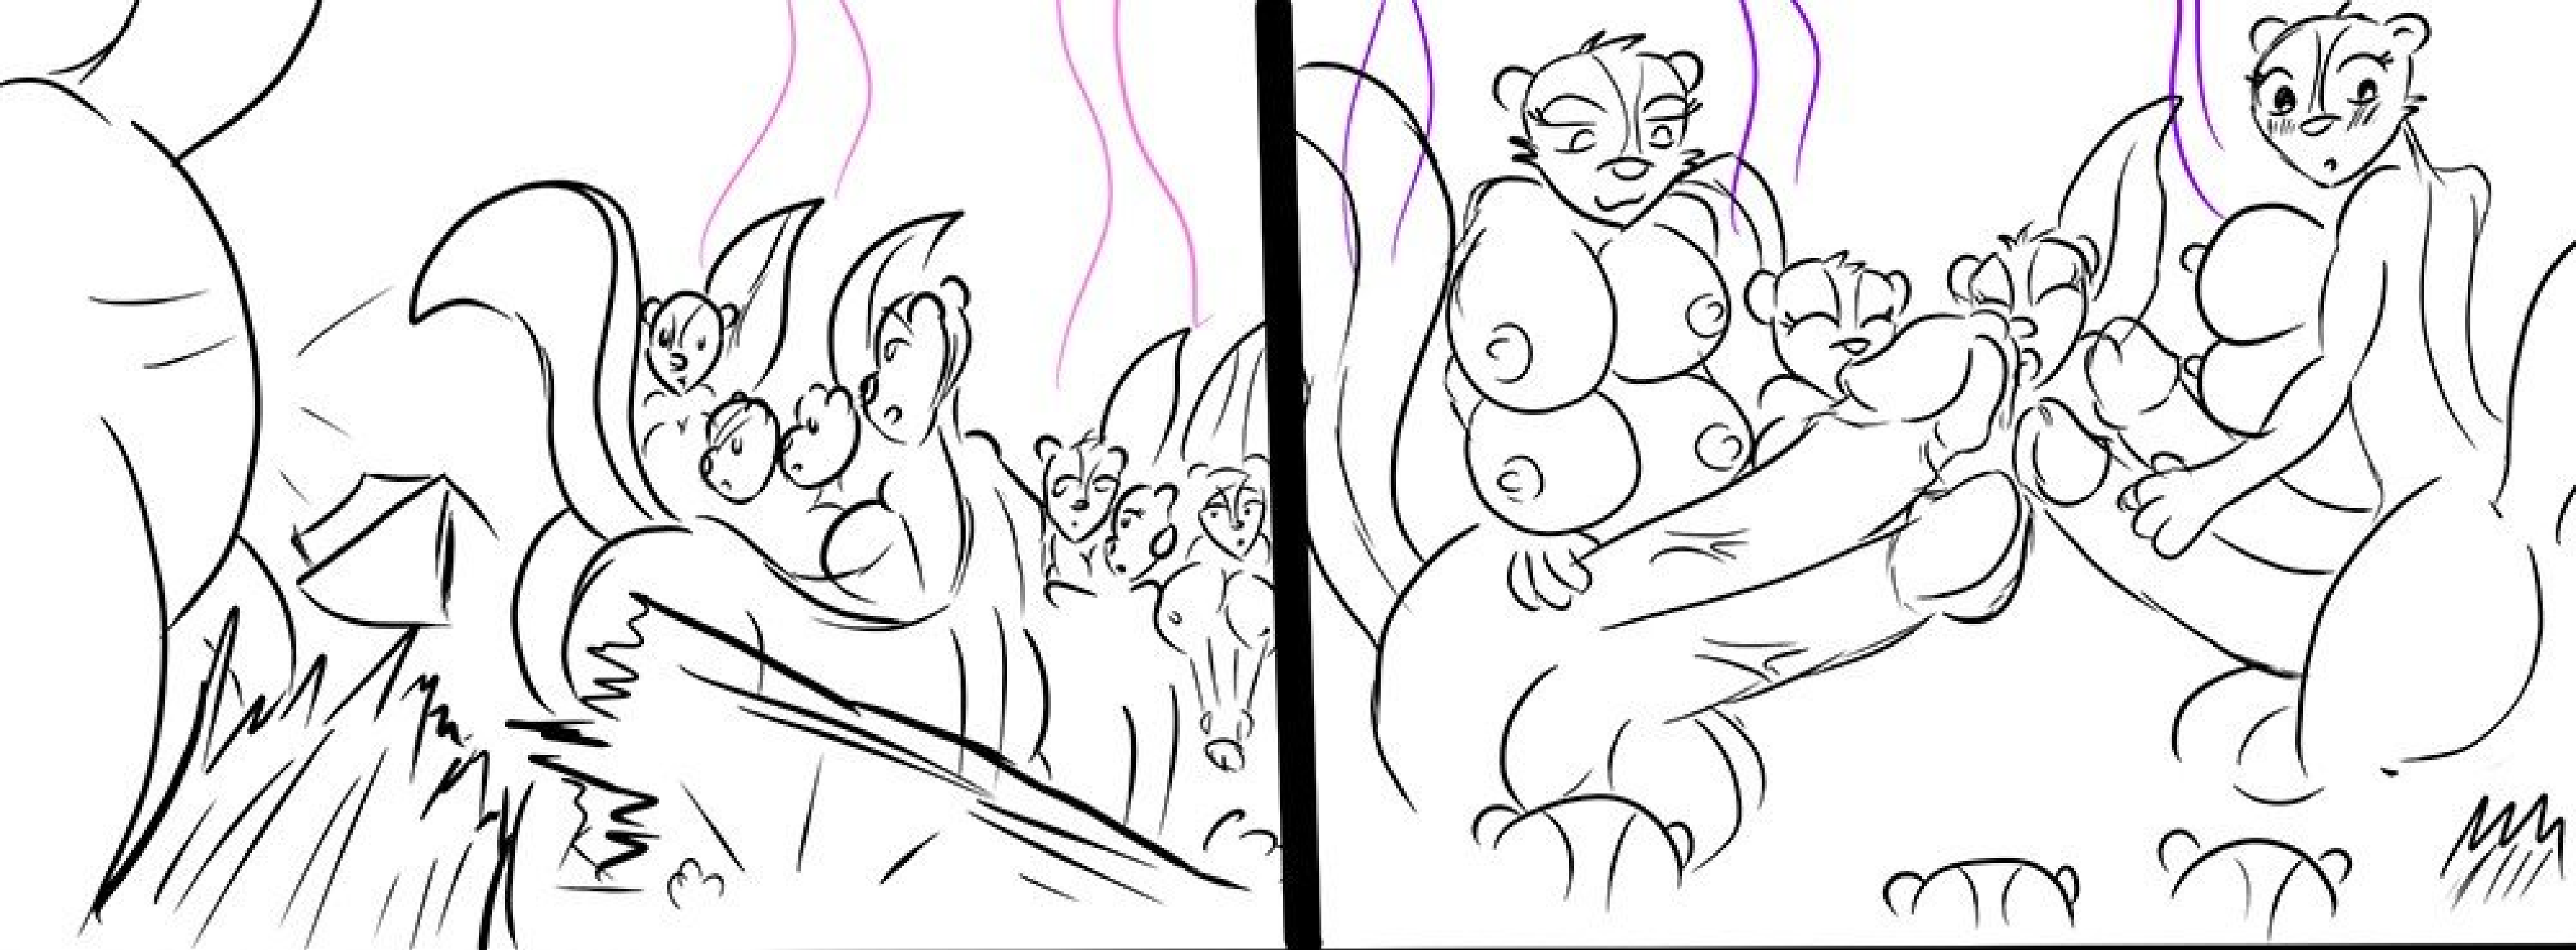

Mating between Alpha and Gamma begins, with the now hermaphroditic Alpha mounting the more than willing Gamma. The first thrust initiates Gamma's transformation into another instance of Alpha (thus making the 'Gamma' designation kinda short-lived, whoops). Orgasm/ejaculation occurs very quickly from both parties, the wolf now a fully-anthro clone of Alpha. Pregnancy begins in both subjects, and their arousal remains at extremely heightened levels.

Both skunks enjoy a moment of afterglow as they utilize their new hands to explore their bodies. With seemingly little effort, they begin birthing more skunks from their overdeveloped female sexes. Their offspring are quite large, and it seems that birthing has caused their overall growth rate to increase quite drastically.

Alpha and its clone-mate are now the largest specimens, with their offspring quickly catching up. Further mutation has resulted in additional genitalia and breast tissue. Unprecedented cases of spontaneous mitosis occur between the offspring, who, uh, still display parthenogenic pregnancies. Things seem to be getting out of hand, shouldn't we-- oh, they're growing again...

the, uh, the skunks are getting really big now. One of them knocks over a tree with its thrusting and the Alphas re-encounter the Betas. Most of them have now mutated to tauric states, and while they aren't as big as the alphas, they seem to have had a higher birth rate, numbering at least a dozen or more. The clouds of musk seem to mix, spontaneously sharing and mixing the mutations of each group, the alphas going tauric and birthing faster as the betas get even larger and grow larger attributes. Seriously, we're not going to do anything? Okay...

More mutations and pregnancy and growth and what have you. Some of the specimens now sport multiple heads, most of them have multiple dicks and boobs, the woods the event began in are flooded with milk and various sexual and reproductive fluids. The skunks are now so big the trees barely come up to their overgrown hips. Predictably out of control, as usual. I'm going to lunch. *snff* What the hell is that smell? It smells... kinda good, actually...
